

EZLIFT
EZ

more efficient, more flexible,
more maneuverable

Effective

Efficient

Reliable

Multipurpose: Solar Turbines uses an EZLift to handle 12 tonne turbines at their Gosselies production facility in France, to load them into crates, and then to load those crates on to trucks for shipping.

The EZLift has many advantages over forklifts for handling containers and industrial loads in warehouses and factories.

Straddling the load is the key to the EZLift's success. It distributes the weight, keeping the wheel loadings low and your pavement costs down (10t per wheel for a 32t load). It is inherently stable and unlike a forklift is virtually impossible to tip over. It is structurally and mechanically efficient, keeping reliability up and your operating and maintenance costs down. And it provides a flexibility in how and where to attach to the load that is simply not possible with forklifts.

Special requirements that are off-the-shelf: with a system of standardized options, the EZLift can be configured for a wide range of loads and operations, from containers through to industrial loads up to 40 tonnes, from clearing low height doorways through to tipping a container to 50 degrees.

Accessible and maneuverable: quiet enough to operate indoors, rugged enough to operate outside on compacted hardstand, with a footprint only a little larger than its load, the EZLift can maneuver through confined spaces. Loads can be picked up lengthwise and moved down corridors too narrow for a forklift.

Easy to operate: with a choice of manual, pendant or radio controls, the operator has the freedom to either ride on the machine or to move around the machine for greater visibility, inspection and control.

Effective and reliable: with 40 years of continuous innovation, the elegant simplicity of the EZLift design offers unparalleled reliability, availability and a 20 year plus operating life.
